

# Breakdown of Thermalization in Disordered Quantum Systems: Many Body Localization and its Consequences

The search for a Time Crystal

Adrien Kuntz

Under the direction of Marco Schiro

Ecole Normale Supérieure, Paris

July 03, 2017

# Outline

- 1 Introduction : What is a Time Crystal ?
- 2 Driven Systems
  - Time Crystal conditions
  - Floquet spectrum
  - Example
- 3 Model : Harmonically driven spin chain
  - Hamiltonian and diagonalization
  - Numerical results
- 4 Conclusion

# Space crystal

# Space crystal

- $\langle \hat{O}(\mathbf{x}) \rangle = Cst$  (at finite size)

# Space crystal

- $\langle \hat{O}(\mathbf{x}) \rangle = Cst$  (at finite size)
- $\langle \hat{O}(\mathbf{x}) \hat{O}(\mathbf{x}') \rangle = f(\mathbf{x} - \mathbf{x}')$   
periodic

# Time Crystal in equilibrium

$$\lim_{V \rightarrow \infty} \langle \hat{O}(\mathbf{x}, t) \hat{O}(\mathbf{0}, 0) \rangle = f(\mathbf{x}, t)$$

periodic in time (and possibly in space)

# Time Crystal in equilibrium

$$\lim_{V \rightarrow \infty} \langle \hat{O}(\mathbf{x}, t) \hat{O}(\mathbf{0}, 0) \rangle = f(\mathbf{x}, t)$$

periodic in time (and possibly in space)

Remark :  $\lim_{V \rightarrow \infty} \langle \hat{O}(t) O(0) \rangle = f(t)$  periodic in time not sufficient

# Time Crystal in equilibrium

$$\lim_{V \rightarrow \infty} \langle \hat{O}(\mathbf{x}, t) \hat{O}(\mathbf{0}, 0) \rangle = f(\mathbf{x}, t)$$

periodic in time (and possibly in space)

Remark :  $\lim_{V \rightarrow \infty} \langle \hat{O}(t) O(0) \rangle = f(t)$  periodic in time not sufficient

⇒ Watanabe Oshikawa 2015 : impossible in equilibrium

  - Hamiltonian and diagonalization
  - Numerical results
- 4 Conclusion

# Time Crystal in a driven system

$$\hat{H}(t + T) = \hat{H}(t)$$

# Time Crystal in a driven system

$$\hat{H}(t + T) = \hat{H}(t)$$

Conditions : in the limit  $V \rightarrow \infty$  then  $t \rightarrow \infty$

# Time Crystal in a driven system

$$\hat{H}(t + T) = \hat{H}(t)$$

Conditions : in the limit  $V \rightarrow \infty$  then  $t \rightarrow \infty$

- TTSB :  $\langle \hat{O}(t + T) \rangle \neq \langle \hat{O}(t) \rangle$

# Time Crystal in a driven system

$$\hat{H}(t + T) = \hat{H}(t)$$

Conditions : in the limit  $V \rightarrow \infty$  then  $t \rightarrow \infty$

- TTSB :  $\langle \hat{O}(t + T) \rangle \neq \langle \hat{O}(t) \rangle$
- Rigidity : stable to perturbations

# Outline

- 2 Driven Systems**
  - Time Crystal conditions
  - Floquet spectrum**
  - Example
- 3 Model : Harmonically driven spin chain
  - Hamiltonian and diagonalization
  - Numerical results
- 4 Conclusion

# Bloch and Floquet theorems

$$\text{Crystal : } \psi_{\alpha}(\mathbf{r}) = e^{i\mathbf{k}_{\alpha}\mathbf{r}} u_{\alpha}(\mathbf{r}), \quad u_{\alpha}(\mathbf{r} + \mathbf{R}) = u_{\alpha}(\mathbf{r})$$

# Bloch and Floquet theorems

$$\text{Crystal : } \psi_{\alpha}(\mathbf{r}) = e^{i\mathbf{k}_{\alpha}\mathbf{r}} u_{\alpha}(\mathbf{r}), \quad u_{\alpha}(\mathbf{r} + \mathbf{R}) = u_{\alpha}(\mathbf{r})$$

$$\text{Periodic Hamiltonian : } \psi_{\alpha}(t) = e^{-i\mu_{\alpha}t} u_{\alpha}(t), \quad u_{\alpha}(t + T) = u_{\alpha}(t),$$

$$\mu_{\alpha} \in \left[-\frac{\Omega}{2}, \frac{\Omega}{2}\right]$$

# Evolution of an observable

$$|\Psi(t)\rangle = \sum_{\alpha} R_{\alpha} e^{-i\mu_{\alpha}t} |u_{\alpha}(t)\rangle$$

# Evolution of an observable

$$|\Psi(t)\rangle = \sum_{\alpha} R_{\alpha} e^{-i\mu_{\alpha}t} |u_{\alpha}(t)\rangle$$

$\Rightarrow$

$$\begin{aligned} O(t) &\equiv \langle \Psi(t) | \hat{O} | \Psi(t) \rangle \\ &= \sum_{\alpha} |R_{\alpha}|^2 O_{\alpha\alpha}(t) + \sum_{\alpha \neq \beta} O_{\alpha\beta}(t) R_{\alpha}^* R_{\beta} e^{i(\mu_{\beta} - \mu_{\alpha})t} \end{aligned}$$

# Evolution of an observable

$$|\Psi(t)\rangle = \sum_{\alpha} R_{\alpha} e^{-i\mu_{\alpha}t} |u_{\alpha}(t)\rangle$$

$\Rightarrow$

$$\begin{aligned} O(t) &\equiv \langle \Psi(t) | \hat{O} | \Psi(t) \rangle \\ &= \sum_{\alpha} |R_{\alpha}|^2 O_{\alpha\alpha}(t) + \sum_{\alpha \neq \beta} O_{\alpha\beta}(t) R_{\alpha}^* R_{\beta} e^{i(\mu_{\beta} - \mu_{\alpha})t} \end{aligned}$$

- Clean system : destructive interferences

# Evolution of an observable

$$|\Psi(t)\rangle = \sum_{\alpha} R_{\alpha} e^{-i\mu_{\alpha}t} |u_{\alpha}(t)\rangle$$

$\Rightarrow$

$$\begin{aligned} O(t) &\equiv \langle \Psi(t) | \hat{O} | \Psi(t) \rangle \\ &= \sum_{\alpha} |R_{\alpha}|^2 O_{\alpha\alpha}(t) + \sum_{\alpha \neq \beta} O_{\alpha\beta}(t) R_{\alpha}^{*} R_{\beta} e^{i(\mu_{\beta} - \mu_{\alpha})t} \end{aligned}$$

- Clean system : destructive interferences
- Disorder seems essential

# Our motivation

Most of the research on TC :  $T \rightarrow 2T$

# Our motivation

Most of the research on TC :  $T \rightarrow 2T$

To this aim : "Bang-Bang" Hamiltonian

# Our motivation

Most of the research on TC :  $T \rightarrow 2T$

To this aim : "Bang-Bang" Hamiltonian

Questions :

- TC with a harmonic drive ?
- Importance of protocol in quantum for period doubling ?

# Hamiltonian

$$\hat{H}(t) = - \sum_{j=1}^L J_j \left( (1 + \gamma) \sigma_j^x \sigma_{j+1}^x + (1 - \gamma) \sigma_j^y \sigma_{j+1}^y \right) - \sum_{j=1}^L h_j(t) \sigma_j^z$$

$$h_j(t) = h_j^0 + h_1 \cos(\Omega t)$$

# Hamiltonian

$$\hat{H}(t) = - \sum_{j=1}^L J_j \left( (1 + \gamma) \sigma_j^x \sigma_{j+1}^x + (1 - \gamma) \sigma_j^y \sigma_{j+1}^y \right) - \sum_{j=1}^L h_j(t) \sigma_j^z$$

$$h_j(t) = h_j^0 + h_1 \cos(\Omega t)$$

- Bogoliubov transformation :  $\{\sigma_i^\alpha\} \rightarrow \{c_i\}$   
 $\Rightarrow$  quadratic fermionic Hamiltonian
- Solve Heisenberg eqs of motion

# Typical case

**Figure:** Floquet spectrum density for parameters :  $h_m = 1$ ,  $h_0 = 1$ ,  $h_1 = 1$ ,  $L = 500$ ,  $\gamma = 1$ ,  $J = 1$ ,  $T = 1$  and averaged over 50 realizations.

**Figure:** magnetization for parameters :  $h_m = 1$ ,  $h_0 = 1$ ,  $h_1 = 1$ ,  $L = 100$ ,  $\gamma = 1$ ,  $J = 1$ ,  $T = 1$ ,  $t = 100$  and averaged over 20 realizations.

## High frequency

**Figure:** Floquet spectrum for parameters :  $h_m = 1$ ,  $h_1 = 1$ ,  $L = 500$ ,  $\gamma = 1$ ,  $J = 1$ ,  $T = 0.1$  for different values of  $h_0$  and averaged over 50 realizations.

**Figure:** magnetization for parameters :  $h_m = 1$ ,  $h_1 = 1$ ,  $L = 100$ ,  $\gamma = 1$ ,  $J = 1$ ,  $T = 0.1$ , evaluated using a total time of  $t = 10$ , and with different values of  $h_0$

# Dependance on the observable

**Figure:** Clean case,  $\times$  time correlation function for parameters :  $h_m = 3$ ,  $h_1 = 0.3$ ,  $L = 100$ ,  $\gamma = 1$ ,  $J = 1$ ,  $T = 1$

**Figure:** Disordered case,  $\times$  time correlation function for parameters :  $h_m = 3$ ,  $h_1 = 0.3$ ,  $h_0 = 1$ ,  $L = 100$ ,  $\gamma = 1$ ,  $J = 1$ ,  $T = 1$ ,  $n = 200$

# Outline

  - Hamiltonian and diagonalization
  - Numerical results
- 4 Conclusion

# Conclusion

- Quantum TC seems to depend strongly on the protocol : Harmonic  $\rightarrow$  synchronization

# Conclusion

- Quantum TC seems to depend strongly on the protocol : Harmonic  $\rightarrow$  synchronization
- We are exploring now the dependance on observables

# Conclusion

- Quantum TC seems to depend strongly on the protocol : Harmonic  $\rightarrow$  synchronization
- We are exploring now the dependance on observables
- A paper is coming

# Method of diagonalization

$$\sigma_j^x = K_j(c_j^\dagger + c_j)$$

$$\sigma_j^y = iK_j(c_j^\dagger - c_j)$$

$$\sigma_j^z = (2c_j^\dagger c_j - 1)$$

with

$$K_j = \prod_{i < j} (1 - 2c_i^\dagger c_i) = \exp \left( i\pi \sum_{i < j} c_i^\dagger c_i \right)$$

# Method of diagonalization

⇒

$$\begin{aligned}\hat{H}(t) &= -2 \sum_{i=1}^L J_i (\gamma c_i^\dagger c_{i+1}^\dagger + c_i^\dagger c_{i+1} + h.c.) - 2 \sum_{i=1}^L h_i(t) c_i^\dagger c_i + \sum_{i=1}^L h_i(t) \\ &= 2 \sum_{\mu} \varepsilon_{\mu} \left( \gamma_{\mu}^\dagger \gamma_{\mu} - 1/2 \right)\end{aligned}$$

Then

$$i \frac{dc_j}{dt} = [c_j, \hat{H}]$$
